

Introduction to Flowchart:

Honestly, I was really having a hard time trying to understand everything about programming due to the fact that I am not an IT student nor have any knowledge or whatsoever with computer science. To sum it all up, I have no idea how to construct a flowchart, like, where do I begin? What kind of words (variables) do I have to use? I am just so lost with everything. This was also my problem before (this is my 3rd time taking Progcon) The instructor (same professor) that I had this past 2 repeats also contributed to my hardships in passing this subject, because she does not explain all that we have to learn and know, and it frustrates me so bad.

However, I did learn some basics about flowchart, examples are, Flowchart is a systematic way of planning on how a program should function by using this process and that this is the most crucial stage of all for programmers according to the slides provided. Flowcharting uses shapes which each has its different purpose in the process.

Using an awesome method like Kahoot to let students learn while having fun is the best way.
